

Multigenerational Households: 2009–2011

American Community Survey Briefs

By Daphne A. Lofquist

Issued October 2012

ACSB/11-03

INTRODUCTION

A topic of growing interest is that of multigenerational families—defined here as family households consisting of three or more generations. In 2000, 3.7 percent of households in the United States were multigenerational.¹ By 2010, multigenerational households increased to 4.0 percent.²

Multigenerational households may be more likely to reside in areas where new immigrants live with their relatives, in areas where housing shortages or high costs force families to double up their living arrangements, or in areas that have relatively high percentages of children born to unmarried mothers who live with their children in their parents' homes.³ This brief provides information by state on three types of multigenerational households and differences by race or Hispanic origin of the householder in multigenerational households. It also examines the geographic distribution of multigenerational households as a percentage of family households by county. We concentrate on family households in order to remove the differential proportion of nonfamily households across states. More than one-quarter of all American households are one person living alone, and this proportion varies by state.⁴

This report is one of a series produced to highlight results from the 2009–2011 American Community Survey (ACS). The ACS provides detailed estimates of

Multigenerational Households

These households are family households consisting of three or more generations.

Three types of multigenerational households are discussed in this brief:

1. Includes a householder, a parent or parent-in-law of the householder, and a child of the householder.
2. Includes a householder, a child of the householder, and a grandchild of the householder.
3. Includes a householder, a parent or parent-in-law of the householder, a child of the householder, and a grandchild of the householder.

demographic, social, economic, and housing characteristics for congressional districts, counties, places, and other localities every year. A description of the ACS is provided in the text box "What Is the American Community Survey?"

MULTIGENERATIONAL HOUSEHOLDS

In the 2009–2011 3-year ACS data file, there were over 76 million family households. Of these, approximately 4.3 million (5.6 percent) were multigenerational households (Table 1). Hawaii had the highest percentage of multigenerational households, accounting for 11.1 percent of all family households in that state. Over 85 percent of states exceeding the national level of

5.6 percent were in the South and West. Southern states with percentages above the national level include the District of Columbia (a state equivalent), Florida, Georgia, Louisiana, Maryland, Mississippi, and Texas. These states ranged from 5.9 percent to 7.3 percent. The states in the West with higher than the national level of multigenerational households include Arizona, California, Hawaii, Nevada, and New Mexico, with a range from 6.2 percent to 11.1 percent. In the Northeast, New Jersey and New York had percentages above the national level.⁵ The state with the smallest percentage of multigenerational households was North Dakota (1.9 percent).

Using ACS data, we can distinguish three types of multigenerational households. Among multigenerational households nationally, 64.6 percent included a householder, a child of the householder, and a grandchild of the householder. The percentage of multigenerational households that were of this type varied from 50.8 percent for New Jersey to 81.7 percent for South Dakota, which is one of the highest.⁶ These multigenerational households were located primarily in the Midwest and South.

Thirty-four percent of multigenerational households containing a householder, a parent or

⁵ There are four census regions (Northeast, Midwest, South, and West). The Northeast region includes Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont. The Midwest region includes Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin. The South region includes Alabama, Arkansas, Delaware, the District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. The West region includes Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

⁶ New Jersey is not statistically different from Nevada.

parent-in-law, and a child tended to be in the Northeast and West. The percentage of multigenerational households that were of this type for the 50 states and the District of Columbia ranged from about 18.0 percent for Mississippi, West Virginia, and South Dakota, which were among the lowest, to 47.9 percent for New Jersey.

Only 1.7 percent of multigenerational households contained a parent or parent-in-law, a householder, a child of the householder, and a grandchild of the householder.

MULTIGENERATIONAL HOUSEHOLDS BY COUNTY

Figure 1 shows multigenerational households as a percentage of family households by county. This map reveals a concentration of multigenerational households located in the South, West, and eastern coastline. The South and West tend to have high concentrations of lower income populations and Hispanics. Recent immigrants, those experiencing economic distress, and those hit hard by the housing crisis may be more likely to live in multigenerational households.⁷ States having a high proportion of American Indians and Alaska Natives (such as New Mexico and Arizona) also had a high percentage of multigenerational households. Data from Census 2000 also showed a higher proportion of multigenerational households in these regions.⁸

MULTIGENERATIONAL HOUSEHOLDS BY RACE

Table 2 shows multigenerational households as a percentage of family households by the race of

⁷ Kochhar, Rakesh, and D'Vera Cohn, "Fighting Poverty in a Tough Economy, Americans Move in With Their Relatives," Pew Social and Demographic Trends Publication, 2011, <www.pewsocialtrends.org/files/2011/10/Multigenerational-Households-Final1.pdf>.

⁸ See Simmons and O'Neill, op. cit.

the householder. The percentage of family households that were multigenerational ranged from 3.7 percent for non-Hispanic White alone households to 13.0 percent for Native Hawaiian and Pacific Islanders. Over 10 percent of Hispanic and American Indian and Alaska Native (AIAN) households were multigenerational, while over 9 percent of Black and Asian households were multigenerational.^{9,10} About 8 percent of households with a multiracial householder were multigenerational.

American Indian and Alaska Native households in states with large AIAN populations tended to have higher percentages than the national level that were multigenerational, such as Alaska, Arizona, Montana, New Mexico, South Dakota, and Wyoming. This may be related to larger American Indian populations concentrated on reservation lands where cultural norms may encourage multigenerational living, and economic conditions may make it difficult for younger people to establish their own households.

States with high percentages of Asian multigenerational households were often those that also contained a high proportion of Asians, such as California, Hawaii, and New York. Similarly, states with high percentages of Hispanic multigenerational households were often those where Hispanics are likely to live, including California and New York. Counter to this trend is Florida, which had a lower than national level of Hispanic family households that were multigenerational.

⁹ The percentage of American Indian and Alaska Native households and Hispanic households are not statistically different from each other.

¹⁰ The percentage of Black households and Asian households are not statistically different from each other.

Table 1.

Multigenerational Households by Type: 2009–2011(In percent. For information on confidentiality protection, sampling error, nonsampling error, and definitions, see www.census.gov/acs/www)

¹ Data are based on a sample and are subject to sampling variability. A margin of error is a measure of an estimate's variability. The larger the margin of error is in relation to the size of the estimate, the less reliable the estimate. This number when added to and subtracted from the estimate forms the 90 percent interval.

Note: Due to rounding some margin of errors round to zero, even though they are not actually zero.

(NA) Not available. (The denominator as well as the numerator are zero, therefore the margin of error cannot be calculated.)

¹ Data are based on a sample and are subject to sampling variability. A margin of error is a measure of an estimate's variability. The larger the margin of error is in relation to the size of the estimate, the less reliable the estimate. This number when added to and subtracted from the estimate forms the 90 percent interval.

Note: Due to rounding some margin of errors round to zero, even though they are not actually zero.

Source: U.S. Census Bureau, 2009–2011 American Community Survey.

What Is the American Community Survey?

The American Community Survey (ACS) is a nationwide survey designed to provide communities with reliable and timely demographic, social, economic, and housing data for the nation, states, congressional districts, counties, places, and other localities every year. It has an annual sample size of about 3.3 million addresses across the United States and Puerto Rico and includes both housing units and group quarters (e.g., nursing facilities and prisons). The ACS is conducted in every county throughout the nation, and every municipio in Puerto Rico, where it is called the Puerto Rico Community Survey. Beginning in 2006, ACS data for 2005 were released for geographic areas with populations of 65,000 and greater. For information on the ACS sample design and other topics, visit www.census.gov/acs/www.

SOURCE AND ACCURACY

The data presented in this report are based on the ACS sample interviewed in 2009, 2010, and 2011. The estimates based on this sample approximate the actual values and represent the entire household

and group quarters population. Sampling error is the difference between an estimate based in a sample and the corresponding value that would be obtained if the estimate were based on the entire population (as from a census).

Measures of the sampling errors are provided in the form of margins of error for all estimates included in this report. All comparative statements in this report have undergone statistical testing, and comparisons are significant at the 90 percent level unless otherwise noted. In addition to sampling error, nonsampling error may be introduced during any of the operations used to collect and process survey data such as editing, reviewing, or keying data from questionnaires. For more information on sampling and estimation methods, confidentiality protection, and sampling and nonsampling errors, please see the 2011 ACS Accuracy of the Data document located at www.census.gov/acs/www/Downloads/data_documentation/Accuracy/ACS_Accuracy_of_Data_2011.pdf.
